Elimination of New HIV Infections Among Children by 2015 And Keeping Their Mothers Alive

Zimbabwe (draft)

Country Situation · · · ·

Background Statistics		
HIV prevalence - adults (ages 15-49) _[1] *	14.3% [13.4-15.4%]	2009
HIV prevalence - pregnant women (all ages)_{\scriptscriptstyle [2]}{}^{*}	13.6%	2009
Number of women living wih HIV delivering ${}_{\scriptscriptstyle [\!3]}$	52,700	2011
Est. # children (ages 0-14) living with $\text{HIV}_{\scriptscriptstyle[1]}{}^{\star}$	150,000 [92,000-200,000]	2009
Maternal mortality ratio[4]	570/100,000	2010
Est. annual births _[5]	374,000	2010
Infant mortality rate _[6]	51/1,000	2010
Under-5 mortality rate _[7]	78/1,000	2010

Adult HIV prevalence (ages 15-49) in Zimbabwe, although still high, declined significantly from 23.7% in 2001 to 14.3% in $2009_{[1]}$. HIV prevalence among pregnant women (all ages) was also high in 2009 (13.6%) and similar to the general adult population.

Facility coverage of PMTCT programming within ANC services is moderate (74%)_[8]. HIV testing among pregnant women increased significantly from 29% in 2005 to 90% in 2010_[9] and, in 2011, 78% of pregnant women with HIV received ARVs for PMTCT_[3]. Between 2009 and 2011, Zimbabwe has seen a 45% decline in the number of new paediatric HIV infections – from 17,700 to 9,700_[3]. Coverage of early infant diagnosis (14%) and paediatric ART (32%), however, were still very limited in 2010_[9].

Zimbabwe has adopted WHO 2010 PMTCT Guidelines Option A regimen for prophylaxis, and a national PMTCT scale-up plan (2011- 2015) is in place_[10].

Reaching High Level Targets ·

Global 2015 Targets

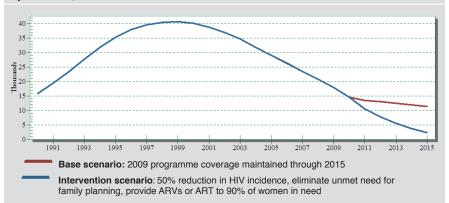

- Reduce the number of new HIV infections among children by 90%
- Reduce the number of HIV-associated deaths to women during pregnancy, delivery or puerperium by 50%

Child Targets

- Reduce under-five deaths due to HIV by at least 50%
- Provide antiretroviral therapy for all children with HIV

An estimated 18,000 children were newly infected with HIV in 2009. Modeling data from UNAIDS indicates that if all interventions are scaled up and Global Plan targets are achieved (see Figure 1), there would be 2,300 new child infections in 2015 – an 87% decline in the number of new child infections from $2009_{[11]}$.

Figure 1: Number of new child HIV infections due to mother to child transmission, by scenario, Zimbabwe

Global Plan Targets, Baseline and Current Status

	Indicators	2009 Baseline [or last available data]	2010	2011	2012	2013	2014	2015
Overall Targets	Number new paediatric HIV infections _[3]	17,700	-	9,700	—	-	—	—
Ove Tarç	Number HIV-associated maternal deaths[4]	2,800 (2005)	1,680	-	—	-	—	—
Child Targets	Percentage of under-5 deaths due to HIV	25%[12] (2008)	20%[7]	-	_	_	_	_
Ch Tarç	ART coverage among children (ages $0-14)_{[3]}$	22%	_	37%	_	_	_	_
Prong One	HIV incidence in women (ages 15-49)[3]	1.68%	-	1.25%	_	_	_	_
Prong Two	Percentage of married women with unmet need for family planning (ages 15-49)	16% [13] (2006)	-	13%[14]	_	_	_	_
	Mother-to-child transmission rate[3]	31%	-	18%	_	—	-	—
Prong Three	Maternal ARV coverage (prophylaxis and ART coverage, excluding single-dose nevirapine) _[3]	11% ^a	-	78%	-	-	-	_
	Breastfeeding ARV Coverage _[3]	2%	-	19%	-	-	-	—
Prong Four	ART coverage among HIV+ pregnant women in need of treatment _[3]	4%	_	51%	_	_	_	_

Program Status According to PMTCT Prongs

Unite For Children Unite Against AIDS

Primary prevention of HIV among women of childbearing age Preventing unintended pregnancies among women living with HIV

Global 2015 Targets

- Reduce HIV incidence in women (ages 15-49) by 50%
- · Reduce unmet need for family planning among women to zero

Background Statistics		
Young people (ages 15-24) HIV prevalence[1]*	Female: 6.9% [5.3-9.3%] Male: 3.3% [2.5-4.4%]	2009
Condom use at last sex among young people (ages 15-24) with 2+ sexual partners in the last 12 months $_{\mbox{\tiny [14]}}$	Female: 39%* Male: 51%	2010/ 2011
Male partners of pregnant women attending ANC tested in last 12 months $_{\mbox{\tiny [B]}}{}^{*}$	Male: 8%	2010
Unintended pregnancies (ages 15-49)[14]	Female: 32%	2010/ 2011

Key Points

Among young people (ages 15-24), young women (6.9%) are more than twice as likely to be HIV-positive as young men (3.3%) in 2009. Condom use at last sex among young people reporting multiple partners in the last year was much lower among females (39%) than males (51%) in 2010-2011 and 32% of pregnancies were unintended, indicating a high unmet need for family planning. In addition, HIV testing coverage among male partners of pregnant women attending ANC remains very low (8% in 2010).

* Based on small denominator (typically 25-49 unweighted cases

Preventing HIV transmission from a woman living with HIV to her infant

No ANC:

100/

Global 2015 Targets

- Reduce overall mother-to-child transmission of HIV to <5%
- •90% of mothers receive perinatal ART or ARVs
- •90% of breastfeeding infant-mother pairs receive ART or ARVs

[†] Indicator calculated from ANC health facility data for numerators and estimates of need for denominators. Not comparable to survey data presented under Background Statistics or elsewhere in this fact sheet.

Key Points

According to facility data, the majority of pregnant women had at least one ANC visit (94%) and were tested for HIV (90%) in 2010, yet survey data suggest that many fewer attended at least 4 ANC visits_[14], as recommended by WHO. Additionally, ANC attendance during the first trimester of pregnancy was still very low in 2010 (19%). Although 66% of pregnant women had access to skilled birth attendance in 2010-2011, the maternal mortality ratio (570/100,000 live births) was still very high_[4]. In 2011, 78% of pregnant women living with HIV received more efficacious ARVs for PMTCT, and 77% of infants born to PWLHIV received ARVs for PMTCT in 2010.

Program Status According to PMTCT Prongs

Providing appropriate treatment, care and support to women living with HIV and their children and families

Global 2015 Target

 90% of HIV-positive pregnant women in need of ART for their own health are started on lifelong ART

Background Statistics

Percentage of HIV-infected pregnant women assessed with CD4 $\text{testing}_{\scriptscriptstyle{[8]}}^{*}$	38%	2010
Percentage of infants born to HIV- infected women started on CTX prophylaxis within 2 months of birth _[9] *	54% [47-62%]	2010
Percentage of infants born to HIV- infected women tested for HIV within 2 months of birth _[9] *	14% [12-16%]	2010

Key Points

In 2010, only a small proportion of HIV-infected pregnant women were assessed with CD4 testing (38%) to determine if they were in need of ART for their own health. Coverage of CTX prophylaxis was moderate (54%) in 2010, although coverage of early infant diagnosis (14%) remained low. Paediatric ART coverage increased from 22% in 2009 to 37% in 2011. Among pregnant women with HIV who received ARVs in 2010, 42% received more effective ARV regimens, 11% received ART for their own health, and 47% still received single dose nevirapine (a regimen no longer recommended by the WHO).

Figure 3: Percentage distribution of various regimens provided to HIV_+ pregnant women to prevent mother-to-child transmission of HIV, 2010_{IB}^*

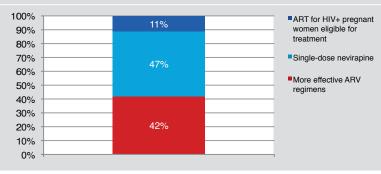

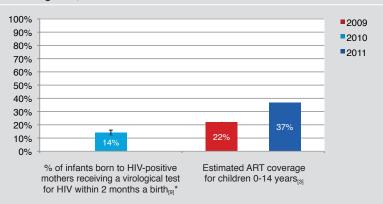

Figure 4: Percentage of infants born to HIV+ women tested for HIV at 2 months of birth (EID) & Percentage of children living with HIV receiving ART, 2009-2011

Key Challenges & The Bottom Line ·

	Key Challenges	The Bottom Line If national EMTCT targets for Zimbabwe are to be met by 2015, the following actions should be considered:
	Limited access to comprehensive PMTCT services and loss to follow-up	Improve availability of comprehensive PMTCT services within ANC to ensure all pregnant women living with HIV and their infants receive more efficacious ARVs for PMTCT
	High unmet need for family planning	Expand access to family planning and strengthen linkages between PMTCT and FP/SRH services
	Despite good ANC coverage, fewer women access skilled attendance at delivery	Improve equitable access to skilled birth attendance
	Few HIV+ pregnant women with HIV receive CD4 testing to determine if they are in need of treatment for their own health	Expand CD4 testing and enroll those eligible for treatment on ART
	Very few infants born to HIV+ mothers are tested for HIV within two months of birth and a significant proportion do not receive CTX pro- phylaxis within two months of birth. Few HIV+ children receive ART.	Expand the provision of CTX prophylaxis, EID, and ART for children with HIV
	Data on some key PMTCT indicators are not available at the na- tional level, hindering tracking of progress towards eMTCT targets	Strengthen routine monitoring system to ensure timely collection and reporting of quality data on Global Plan indicators.
